INDOLINE DERIVATIVES AS 5HT_{2C} ANTAGONISTS

This invention relates to compounds having pharmacological activity, processes for their preparation, to compositions containing them and to their use in the treatment of CNS disorders.

WO 94/04533 (SmithKline Beecham plc) describes indole and indoline derivatives which are described as possessing 5HT_{2C} receptor antagonist activity. A structurally distinct class of compounds has now been discovered, which have been found to have 5HT_{2C} receptor antagonist activity. Certain compounds of the invention also exhibit 5HT_{2B} antagonist activity. 5HT_{2C/2B} receptor antagonists are believed to be of potential use in the treatment of CNS disorders such as anxiety, depression, epilepsy, obsessive compulsive disorders, migraine, Alzheimers disease, sleep disorders, feeding disorders such as anorexia and bulimia, panic attacks, withdrawal from drug abuse such as cocaine, ethanol, nicotine and benzodiazepines, schizophrenia, and also disorders associated with spinal trauma and/or head injury such as hydrocephalus. Compounds of the invention are also expected to be of use in the treatment of certain GI disorders such as IBS.

The present invention therefore provides, in a first aspect, a compound of formula (I) or a salt thereof:

wherein:

P represents phenyl, a quinoline or isoquinoline residue, or a 5-membered or 6-membered aromatic heterocyclic ring containing up to three heteroatoms selected from nitrogen, oxygen or sulphur;

R¹ is hydrogen, C₁₋₆ alkyl, halogen, CF₃, NR⁷R⁸ or OR⁹ where R⁷, R⁸ and R⁹ are independently hydrogen, C₁₋₆ alkyl or arylC₁₋₆alkyl;

R² is hydrogen or C₁₋₆ alkyl;

R³ is C₁₋₆ alkyl;

n is 0 to 3;

m is 0 to 4; and

R⁴ groups are independently C₁₋₆ alkyl optionally substituted by one or more

halogen atoms, C₂₋₆ alkenyl, C₂₋₆ alkynyl, C₃₋₆ cycloalkyl, C₃₋₆ cycloalkyl-C₁₋₆ alkyl, C₁₋₆ alkylthio, C₃₋₆cycloalkylthio, C₃₋₆ cycloalkylC₁₋₆ alkylthio, halogen, nitro, CF₃, OCF₃, SCF₃, SO₂CF₃, SO₂F, formyl, C₂₋₆ alkanoyl, cyano, optionally substituted phenyl or thienyl, NR⁷R⁸, CONR⁷R⁸, or OR⁹ where R⁷, R⁸ and R⁹ are as defined for R¹, CO₂R¹⁰ where R¹⁰ is hydrogen or C₁₋₆ alkyl.

C₁₋₆ Alkyl groups, whether alone or as part of another group, may be straight chain or branched.

The urea moiety can be attached to a carbon or any available nitrogen atom of the ring P, preferably it is attached to a carbon atom. Suitable moieties when the ring P is a 5-membered aromatic heterocyclic ring include isothiazolyl, isoxazolyl, thiadiazolyl and triazolyl. Suitable moieties when the ring P is a 6-membered aromatic heterocyclic ring include, for example, pyridyl, pyrimidyl or pyrazinyl. When P is quinoline, or an isoquinoline residue, the urea moiety can be attached at any position of the ring, preferably to the 4- or 5-position. Preferably P is 3-pyridyl.

Preferably R¹ is hydrogen.

Preferably R² and R³ are hydrogen.

When R⁴ is phenyl or thienyl, optional substituents include those listed above for R¹. Preferred R⁴ groups include C₁₋₆ alkyl, C₁₋₆ alkylthio, halogen, CF₃, and CO₂R¹⁰ where R¹⁰ is hydrogen or C₁₋₆ alkyl. When n is greater than 1 the resulting R⁴ groups can be the same or different. Preferably n is 2, the indoline ring being disubstituted in the 5- and 6-positions. Most preferably the 6-position is substituted by chloro, bromo, or iodo, and the 5-position is substituted by C₁₋₆alkyl, in particular methyl, ethyl, propyl and isopropyl, or C₁₋₆alkylthio, in particular thiomethyl and thioethyl.

It will be appreciated by those skilled in the art that when m is greater than 1 the resulting alkyl groups can be the same or different and can, if desired, be attached to the same carbon atom.

The compounds of the formula (I) can form acid addition salts with acids,
 5 such as conventional pharmaceutically acceptable acids, for example maleic,
 hydrochloric, hydrobromic, phosphoric, acetic, fumaric, salicylic, citric, lactic,
 mandelic, tartaric and methanesulphonic.

Compounds of formula (I) may also form N-oxides or solvates such as
 hydrates, and the invention also extends to these forms. When referred to herein, it is
 10 understood that the term 'compound of formula (I)' also includes these forms.

Certain compounds of formula (I) are capable of existing in stereoisomeric
 forms including enantiomers and the invention extends to each of these
 stereoisomeric forms and to mixtures thereof including racemates. The different
 stereoisomeric forms may be separated one from the other by the usual methods, or
 15 any given isomer may be obtained by stereospecific or asymmetric synthesis. The
 invention also extends to any tautomeric forms and mixtures thereof.

The present invention also provides a process for the preparation of a
 compound of formula (I) or a pharmaceutically acceptable salt thereof, which process
 comprises:

20 the coupling of a compound of formula (II);

with a compound of formula (III);

25

wherein n, m and P are as defined in formula (I), A and B contain the appropriate
 functional group(s) necessary to form the moiety -NR^{2'}CO when coupled, the
 30 variables R^{1'}, R^{2'}, R^{3'} and R^{4'} are R¹, R², R³, and R⁴ respectively, as defined in
 formula (I), or groups convertible thereto, and thereafter optionally and as necessary
 and in any appropriate order, converting any R^{1'}, R^{2'}, R^{3'} and R^{4'}, when other than
 R¹, R², R³, and R⁴ respectively to R¹, R², R³, and R⁴, interconverting R¹, R², R³,

and R^4 and forming a pharmaceutically acceptable salt thereof.

Suitable examples of groups A and B include:

- (i) A is $-N=C=O$ and B is hydrogen,
- (ii) A is $-NR^{2'}COL$ and B is hydrogen,
- 5 (iii) A is $-NHR^{2'}$ and B is COL , or
- (iv) A is halogen and B is $-CONHR^{2'}$

wherein $R^{2'}$ is as defined above and L is a leaving group. Examples of suitable leaving groups L include halogen such as chloro, bromo, imidazole, phenoxy or phenylthio optionally substituted, for example, with halogen.

- 10 When A is $-N=C=O$ and B is hydrogen the reaction is suitably carried out in an inert solvent for example dichloromethane or toluene at ambient or elevated temperature.

- 15 When A is $-NR^{2'}COL$ and B is hydrogen or when A is $-NHR^{2'}$ and B is $-COL$, the reaction is suitably carried out in an inert solvent such as dichloromethane at ambient temperature optionally in the presence of a base, such as triethylamine or in dimethylformamide at ambient or elevated temperature.

When A is halogen and B is $CONHR^{2'}$, the reaction is suitably carried out in an inert solvent such as toluene at elevated temperature, optionally in the presence of a base.

- 20 It should be appreciated that P in formula (II) represents rings P as defined in relation to formula (I) in which R^1 is as defined in relation to formula (I) or groups convertible thereto i.e. $R^{1'}$.

- 25 R^4 groups can be introduced at any suitable stage in the process, preferably R^4 groups are introduced at an early stage in the process. It should be appreciated that it is preferred that all groups R^1 to R^4 are introduced before coupling compounds of formula (II) and (III).

- 30 Suitable examples of groups $R^{1'}$, $R^{2'}$, $R^{3'}$ and $R^{4'}$ which are convertible to R^1 , R^2 , R^3 and R^4 alkyl groups respectively, include acyl groups which are introduced conventionally and may be converted to the corresponding alkyl group by conventional reduction, such as using sodium borohydride in an inert solvent followed by hydrogenolysis in an inert solvent. Hydrogen substituents may be obtained from alkoxycarbonyl groups which may be converted to hydrogen by hydrolysis and decarboxylation. When R^4 is hydroxy it is preferably protected in the

compound of formula (II) as, for example, benzyl which is removed by hydrogenation.

Suitable examples of a group $R^{2'}$ which are convertible to R^2 , include alkoxy carbonyl and benzyl or *para*-methoxybenzyl which are converted to the group where R^2 is hydrogen using conventional conditions.

Interconversions of R^1 , R^2 , R^3 and R^4 are carried out by conventional procedures. For example R^1 halo and R^4 halo may be introduced by selective halogenation of the ring P or the benzene ring of the indoline group using conventional conditions. It should be appreciated that it may be necessary to protect any R^1 to R^4 hydrogen variables which are not required to be interconverted.

Suitable protecting groups and methods for their attachment and removal are conventional in the art of organic chemistry, such as those described in Greene T.W. 'Protective groups in organic synthesis' New York, Wiley (1981).

Compounds of formula (II) in which A is $NHR^{2'}$ are known compounds or can be prepared analogously to known compounds, see, for example, WO 92/05170 (SmithKline Beecham plc).

Compounds of formula (II) in which A is $-N=C=O$ may be prepared by treating a compound of formula (II) in which :

i) A is amino, with phosgene or a phosgene equivalent, in the presence of excess base in an inert solvent.

ii) A is acylazide (i.e. CON_3), via the nitrene, by thermal rearrangement using conventional conditions (ref L.S. Trifonov et al, Helv. Chim. Acta 1987 70 262).

iii) A is $CONH_2$, via the nitrene intermediate using conventional conditions.

Compounds of formula (II) in which A is $NR^{2'}COL$ may be prepared by reacting a compound of formula (II) in which A is $NHR^{2'}$ with phosgene or a phosgene equivalent in an inert solvent, at low temperature, if necessary in the presence of one equivalent of a base such as triethylamine.

Compounds of formula (III) may be prepared according to known methods or analogous to known methods, for example

a) from the appropriate aniline via indole formation (Nordlander [JOC, 1981, 778] or Sundberg [JOC 1984, 249] routes) followed by reduction of the indole ring using sodium cyanoborohydride. It will be appreciated that in certain cases a mixture of indoles will be formed which can be separated at this stage or at a later stage.

b) from the appropriate ortho-methyl nitrobenzene via indole formation (Leimgruber procedure Org Syn Coll vol VII, p34) followed by reduction of the indole ring.

5 c) by aromatic substitution of a suitably protected indole/indoline precursor, for example alkylthio groups maybe introduced by thiocyanation of the indoline ring followed by hydrolysis and alkylation, or

d) by transition metal catalysed coupling reaction using a suitably substituted indole/indoline precursor for example vinylation using the Stille procedure (JACS 1987, 5478)

10 Compounds of formula (II) in which A is halogen and R^{1'} is hydrogen are commercially available.

Novel intermediates of formula (III) also form part of the invention.

Pharmaceutically acceptable salts may be prepared conventionally by reaction with the appropriate acid or acid derivative. N-oxides may be formed
15 conventionally by reaction with hydrogen peroxide or percarboxylic acids.

Compounds of formula (I) and their pharmaceutically acceptable salts have 5HT_{2B/2C} receptor antagonist activity and are believed to be of potential use fo the treatment or prophylaxis of CNS disorders such as anxiety, depression, epilepsy, obsessive compulsive disorders, migraine, Alzheimers disease, sleep disorders,
20 feeding disorders such as anorexia and bulimia, panic attacks, withdrawal from drug abuse such as cocaine, ethanol, nicotine and benzodiazepines, schizophrenia, and also disorders associated with spinal trauma and/or head injury such as hydrocephalus. Compounds of the invention are also expected to be of use in the treatment of certain GI disorders such as IBS.

25 Thus the invention also provides a compound of formula (I) or a pharmaceutically acceptable salt thereof, for use as a therapeutic substance, in particular in the treatment or prophylaxis of the above disorders.

The invention further provides a method of treatment or prophylaxis of the above disorders, in mammals including humans, which comprises administering to
30 the sufferer a therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable salt thereof.

In another aspect, the invention provides the use of a compound of formula (I) or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for the treatment or prophylaxis of the above disorders.

The present invention also provides a pharmaceutical composition, which comprises a compound of formula (I) or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier.

5 A pharmaceutical composition of the invention, which may be prepared by admixture, suitably at ambient temperature and atmospheric pressure, is usually adapted for oral, parenteral or rectal administration and, as such, may be in the form of tablets, capsules, oral liquid preparations, powders, granules, lozenges, reconstitutable powders, injectable or infusable solutions or suspensions or suppositories. Orally administrable compositions are generally preferred.

10 Tablets and capsules for oral administration may be in unit dose form, and may contain conventional excipients, such as binding agents, fillers, tableting lubricants, disintegrants and acceptable wetting agents. The tablets may be coated according to methods well known in normal pharmaceutical practice.

15 Oral liquid preparations may be in the form of, for example, aqueous or oily suspension, solutions, emulsions, syrups or elixirs, or may be in the form of a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, emulsifying agents, non-aqueous vehicles (which may include edible oils), preservatives, and, if desired, conventional flavourings or colourants.

20 For parenteral administration, fluid unit dosage forms are prepared utilising a compound of the invention or pharmaceutically acceptable salt thereof and a sterile vehicle. The compound, depending on the vehicle and concentration used, can be either suspended or dissolved in the vehicle. In preparing solutions, the compound can be dissolved for injection and filter sterilised before filling into a suitable vial or
25 ampoule and sealing. Advantageously, adjuvants such as a local anaesthetic, preservatives and buffering agents are dissolved in the vehicle. To enhance the stability, the composition can be frozen after filling into the vial and the water removed under vacuum. Parenteral suspensions are prepared in substantially the same manner, except that the compound is suspended in the vehicle instead of being
30 dissolved, and sterilization cannot be accomplished by filtration. The compound can be sterilised by exposure to ethylene oxide before suspension in a sterile vehicle. Advantageously, a surfactant or wetting agent is included in the composition to facilitate uniform distribution of the compound.

35 The composition may contain from 0.1% to 99% by weight, preferably from 10 to 60% by weight, of the active material, depending on the method of administration.

The dose of the compound used in the treatment of the aforementioned disorders will vary in the usual way with the seriousness of the disorders, the weight of the sufferer, and other similar factors. However, as a general guide suitable unit doses may be 0.05 to 1000 mg, more suitably 0.05 to 20.0 mg, for example 0.2 to 5
5 mg; and such unit doses may be administered more than once a day, for example two or three a day, so that the total daily dosage is in the range of about 0.5 to 100 mg; and such therapy may extend for a number of weeks or months.

When administered in accordance with the invention, no unacceptable toxicological effects are expected with the compounds of the invention.

Example 46

Pharmaceutical compositions for oral administration may be prepared by combining
 the following:

1) Solid Dosage Formulation

15		% w/w
	Compound of formula 1	10%
	Magnesium stearate	0.5%
	Starch	2.0%
	HPM cellulose	1.0%
20	Microcrystalline cellulose	86.5%

The mixture may be compressed to tablets, or filled into hard gelatin capsules.

The tablet may be coated by applying a suspension of film former (e.g. HPM
 cellulose), pigment (e.g. titanium dioxide) and plasticiser (e.g. diethyl phthalate) and
 25 drying the film by evaporation of the solvent. The film coat can comprise 2.0% to
 6.0% of the tablet weight, preferably about 3.0%.

2) Capsule

		%w/w
30	Compound of formula 1	20%
	Polyethylene glycol	80%

The medicinal compound is dispersed or dissolved in the liquid carrier, with a
 thickening agent added, if required. The formulation is then enclosed in a soft
 35 gelatin capsule by suitable technology.

Example 44

A pharmaceutical composition for parenteral administration may be prepared by combining the following:

5

	Preferred Level
Compound of formula 1	1.0%
Saline	99.0%

The solution is sterilised and sealed in sterile containers.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/EP 94/02148

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claim 10 is directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
